Clean Copy of Claims

The following is a clean copy of amended claim 1 and 3.

1 Claim 1 (Twice amended). A voice transceiver comprising:
2 an input means for inputting compressed voice codes of analog data;
3 an expansion means for digitalizing said compressed voice codes, and expanding and
4 outputting said digital voice data;
5 a buffer means for storing said digital voice data;
6 a detection means for detecting the quantity of data in said digital voice data stored in
7 said buffer, and outputting a detection signal as a detection result;
8 a conversion means for converting said digital voice data into analog voice data based on
9 said detection signal, wherein a data control means for controlling the output of said digital voice
10 data to said conversion means, based on said detection signal; wherein, said data control means
11 outputs a dummy code to said expansion means, in the case when said digital voice data stored in
12 said buffer means is less than a required amount for play back; in contrast, in the case when said
13 buffer means approaches an overflow amount, said data control means does not allow the output
14 of said digital voice data to said conversion means; and
15 a speaker means for emitting said analog voice data into the air.

1 3. A voice transceiver according to claim 1, wherein when said dummy code is inputted into said
2 expansion means, said expansion means outputs digital voice data in which the strength of said
3 compressed voice code inputted immediately prior to said dummy signal is reduced.
